Parameter	Symbol	Value			Unit	Note
		Min.	Typ.	Max.		
Lamp Input Voltage	V_L	639	710	781	V_{RMS}	$I_L = 4.2mA$
Lamp Current	I_L	3.7	4.2	4.7	mA_{RMS}	(1)
Lamp Turn On Voltage	V_S	---	1065(0 °C)	1330(0 °C)	V_{RMS}	(2)
		---	850(25 °C)	1065(25 °C)	V_{RMS}	(2)
Operating Frequency	F_L	40	---	60	KHz	(3)
Lamp Life Time	L_{BL}	50,000	---	---	Hrs	(4)

Note (1) Lamp current is measured by utilizing high frequency current meters as shown below:

Note (2) The voltage shown above should be applied to the lamp for more than 1 second after startup.

Otherwise the lamp may not be turned on.

Note (3) The lamp frequency may produce interference with horizontal synchronous frequency from the display, and this may cause line flow on the display. In order to avoid interference, the lamp frequency should be detached from the horizontal synchronous frequency and its harmonics as far as possible.

Note (4) The lifetime of lamp can be defined as the time in which it continues to operate under the condition $T_a = 25 \pm 2 {}^{\circ}\text{C}$ and $I_L = 3.7\sim4.7 \text{ mA}_{\text{rms}}$ until one of the following events occurs:

- (a) When the brightness becomes or lower than 50% of its original value.
- (b) When the effective ignition length becomes lower than 80% of its original value. (Effective ignition length is defined as an area that has less than 70% brightness compared to the brightness in the center point.)

Note (5) The waveform of the voltage output of inverter must be area-symmetric and the design of the inverter must have specifications for the modularized lamp. The performance of the Backlight, such as lifetime or brightness, is greatly influenced by the characteristics of the DC-AC inverter for the lamp. All the parameters of an inverter should be carefully designed to avoid producing too much current leakage from high voltage output of the inverter. When designing or ordering the inverter please make sure that a poor lighting caused by the mismatch of the Backlight and the inverter (miss-lighting, flicker, etc.) never occurs. If the above situation is confirmed, the module should be operated in the same manners when it is installed in your instrument.

The output of the inverter must have symmetrical (negative and positive) voltage waveform and symmetrical current waveform.(Unsymmetrical ratio is less than 10%) Please do not use the inverter, which has unsymmetrical voltage and unsymmetrical current and spike wave. Lamp frequency may produce interface with horizontal synchronous frequency and as a result this may cause beat on the display. Therefore lamp frequency shall be as away possible from the horizontal synchronous frequency and from its harmonics in order to prevent interference.

Requirements for a system inverter design, which is intended to have a better display performance, a better power efficiency and a more reliable lamp. It shall help increase the lamp lifetime and reduce its leakage current.

- a. The asymmetry rate of the inverter waveform should be 10% below;
- b. The distortion rate of the waveform should be within $\sqrt{2} \pm 10\%$;
- c. The ideal sine wave form shall be symmetric in positive and negative polarities.

* Asymmetry rate:

$$\frac{|I_p - I_{-p}|}{I_{\text{rms}}} * 100\%$$

* Distortion rate

$$I_p (\text{or } I_{-p}) / I_{\text{rms}}$$

Note.

- (1) The supply voltage of the external system for the module input should be the same as the definition of V_{CC} .
- (2) Apply the lamp voltage within the LCD operation range. When the backlight turns on before the LCD operation of the LCD turns off before the backlight turns off, the display may momentarily become abnormal screen.
- (3) In case of $V_{CC} = \text{off level}$, please keep the level of input signals on the low or keep a high impedance.
- (4) T7 should be measured after the module has been fully discharged between power off and on period.
- (5) Interface signal shall not be kept at high impedance when the power is on.
- (6) It is not guaranteed that products are damaged which is caused by not following the Power Sequence.
- (7) It is suggested that V_{CC} falling time follows T6 specification; else slight noise is likely to occur when LCD is turned off (even backlight is already off).

5. OPTICAL CHARACTERISTICS

5.1 OPTICAL SPECIFICATIONS

	Θ_{y-}		80	88			
	Θ_{x+}		80	88			
	Θ_{x-}		80	88			

Note (1)Definition of Viewing Angle (θ_x, θ_y):

Note (2) Definition of Contrast Ratio (CR):

The contrast ratio can be calculated by the following expression.

$$\text{Contrast Ratio (CR)} = L_{255} / L_0$$

L_{255} : Luminance of gray level 255

L_0 : Luminance of gray level 0

$$CR = CR (5)$$

CR (X) is corresponding to the Contrast Ratio of the point X at Figure in Note (4).

Note (3) Definition of Response Time (T_R , T_F):

Note (4) Definition of Luminance of White (L_C):

Measure the luminance of gray level 255 at center point

$$L_C = L (5)$$

$L (x)$ is corresponding to the luminance of the point X at the following figure.

Note (5) Measurement Setup:

The LCD module should be stabilized at given temperature for 60 minutes to avoid abrupt temperature change during measuring. In order to stabilize the luminance, the measurement should be executed after lighting Backlight for 60 minutes in a windless room.

Unless otherwise specified, the ambient conditions are as following.

Ambient Temperature: 25 ± 2 (degreeC)

Ambient Humidity: 25 ~ 85 (%)

Atmospheric Pressure: 86.0 ~ 104.0 (kPa)

Note (6) There is the Uniformity Measurement below:

' L_{bright} ' represents the Luminance of the point that is brighter than the other point to be compared.

' L_{dark} ' represents the Luminance of the point that is darker than the other point to be compared.

Measuring points are shown in the following Fig.

When the backlight is on with all pixels in the white (maximum gray) level, the luminance uniformity is defined as follows;

Where:

L_{bright} : The luminance of the brightness part of the area

L_{dark} : The luminance of the darkest part of the area

1. Adjacent Area

$$\text{Luminance Uniformity} = \frac{L_{dark}}{L_{bright}} \geq 0.90$$

over a circular area of 10mm diameter placed anywhere on the screen.

2. Screen Total

$$\text{Luminance Uniformity} = \frac{L_{dark}}{L_{bright}} \geq 0.70$$

over the entire screen.

Note (3) At testing Vibration and Shock, the fixture in holding the module has to be hard and rigid enough so that the module would not be twisted or bent by the fixture.

The fixing condition is shown as below:

9. PRECAUTIONS

9.1 ASSEMBLY AND HANDLING PRECAUTIONS

- (1) Do not apply rough force such as bending or twisting to the module during assembly.
- (2) To assemble or install module into user's system can be only in clean working areas. The dust and oil may cause electrical short or worsen the polarizer.
- (3) It's not permitted to have pressure or impulse on the module because the LCD panel and Backlight will be damaged.
- (4) Always follow the correct power sequence when LCD module is connecting and operating. This can prevent damage to the CMOS LSI chips during latch-up.
- (5) Do not pull the I/F connector in or out while the module is operating.
- (6) Do not disassemble the module.
- (7) Use a soft dry cloth without chemicals for cleaning, because the surface of polarizer is very soft and easily scratched.
- (8) It is dangerous that moisture come into or contacted the LCD module, because moisture may damage LCD module when it is operating.
- (9) High temperature or humidity may reduce the performance of module. Please store LCD module within the specified storage conditions.
- (10) When ambient temperature is lower than 10°C may reduce the display quality. For example, the response time will become slowly.

9.2 STORAGE PRECAUTIONS

- (1) Do not leave the module in high temperature, and high humidity for a long time. It is highly recommended to store the module with temperature from 0°C to 35°C and relative humidity of less than 70%
- (2) Do not store the TFT – LCD module in direct sunlight
- (3) The module should be stored in dark place. It is prohibited to apply sunlight or fluorescent light in storing

9.3 OPERATION PRECAUTIONS

- (1) The LCD product should be operated under normal condition.
Normal condition is defined as below :
Temperature : $20\pm15^{\circ}\text{C}$
Humidity: $65\pm20\%$
Display pattern: continually changing pattern (Not stationary)
- (2) If the product will be used in extreme conditions such as high temperature, high humidity, high altitude ,display pattern or operation time etc...It is strongly recommended to contact CMO for application engineering advice . Otherwise, Its reliability and function may not be guaranteed.

9.4 SAFETY PRECAUTIONS

- (1) If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contact with hands, skin or clothes, it has to be washed away thoroughly with soap.
- (2) After the module's end of life, it is not harmful in case of normal operation and storage.

9.5 SAFETY STANDARDS

The LCD module should be certified with safety regulations as follows:

- (1) UL60950-1 or updated standard.
- (2) IEC60950-1 or updated standard.
